### Blockchain

Blockchain is a distributed ledger technology that allows for secure, transparent, and tamper-proof transactions. It is often associated with cryptocurrencies like Bitcoin and Ethereum. The technology uses a decentralized network of nodes to maintain a copy of the ledger, ensuring that no single entity has control over the data. This makes it resistant to censorship and fraud. Blockchain is also being explored for various other applications, such as supply chain management, digital identity, and smart contracts. The concept of a "noob" (newbie) is often used to describe someone who is just starting to learn about blockchain technology.

Blockchain	8900	8164	4228
